

Extraction set
for jig-guided
hip revisions

GOMINA
SWISS QUALITY

Novelty from Gomina

For the first time, Gomina has developed an extraction set that allows a hip revision to be done with minimal bone loss. Thanks to innovative production technologies, it is possible to manufacture dimensionally rigid chisels with different radii. The precision ground, sharp cutting edges of the chisels are the result of Gomina's many decades of expertise. The bespoke crafted jigs ensure the application of a precise separation of bone and prosthesis.

The newly developed handle with a quick clamping mechanism offers various fixation positions for the chisels and impresses with its ergonomic design. Chisel and handle are perfectly matched, thus ensuring maximum transmission of force during use. This innovative pioneering extraction set from Gomina makes surgeon's work far easier, leading to shorter operating times.

Entirely for the patient's benefit.
